CUSTOMER SHOPPING DATA — REVIEW

# Retail Performance 2021–2022

A fact-checked review of revenue, category, mall, and churn performance across 10 malls — every figure below is traced back to source SQL and validated.

| $62.7M | 90,933 | +0.18% | 10 |
|---|---|---|---|
| Total Revenue 2021–2022 | Transactions 2021–2022 | YoY Revenue Growth | Shopping Malls |

*Source: customer_shopping_data_cleaned • 90,933 transactions • 2021–2022 year-over-year comparison*

EXECUTIVE SUMMARY

# Revenue is flat — the volume story hides a value problem

**$31.3M → $31.4M**

Total revenue, 2021 → 2022

+$56,521 (+0.18%)

**45,382 → 45,551**

Transactions, 2021 → 2022

+169 (+0.37%)

**$690.06 → $688.74**

Revenue per transaction

-$1.32 (-0.19%)

**95%**

of 2021–2022 revenue comes from Clothing, Shoes & Technology

3 of 8 categories

## The question this raises

**Both transactions and revenue grew by less than 0.4%.** Revenue per transaction actually dipped slightly (-$1.32). With growth this flat and 95% of revenue already concentrated in 3 categories, the opportunity is to strengthen the core rather than chase volume elsewhere.

## Four questions this review answers, in order

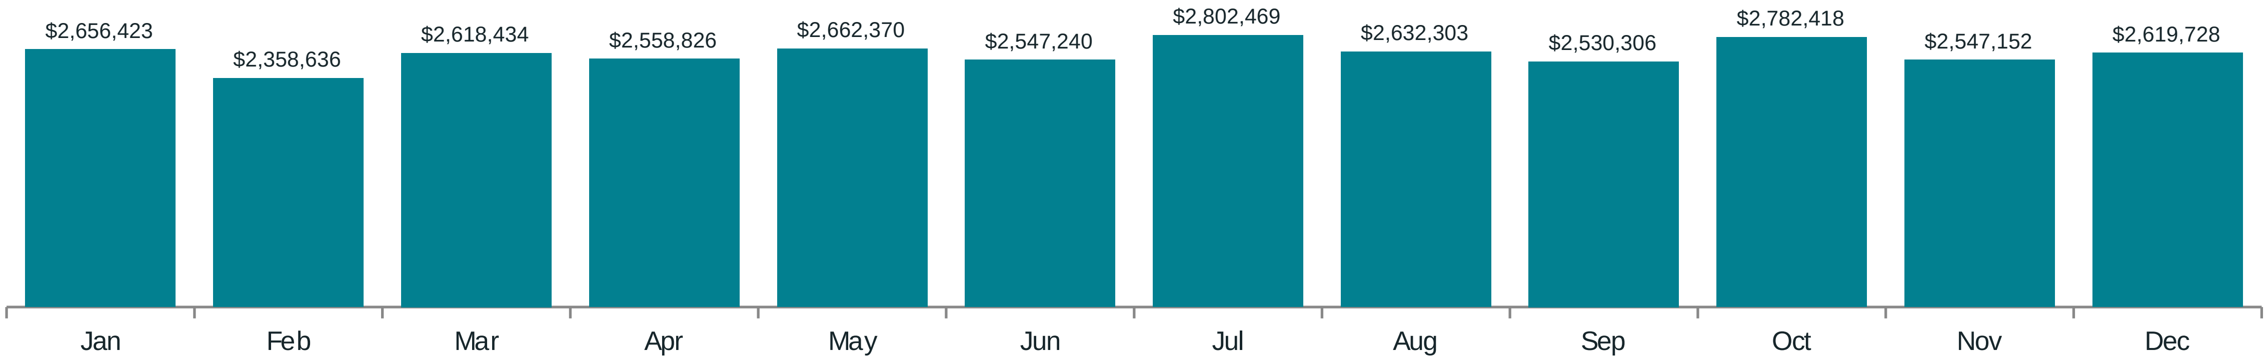
- Are all months equally flat, or do a few stand out?
- Which category is dragging revenue down — and is it offset?
- Is revenue concentration across malls changing?
- How much revenue depends on customers who may already be gone?

REVENUE PERFORMANCE

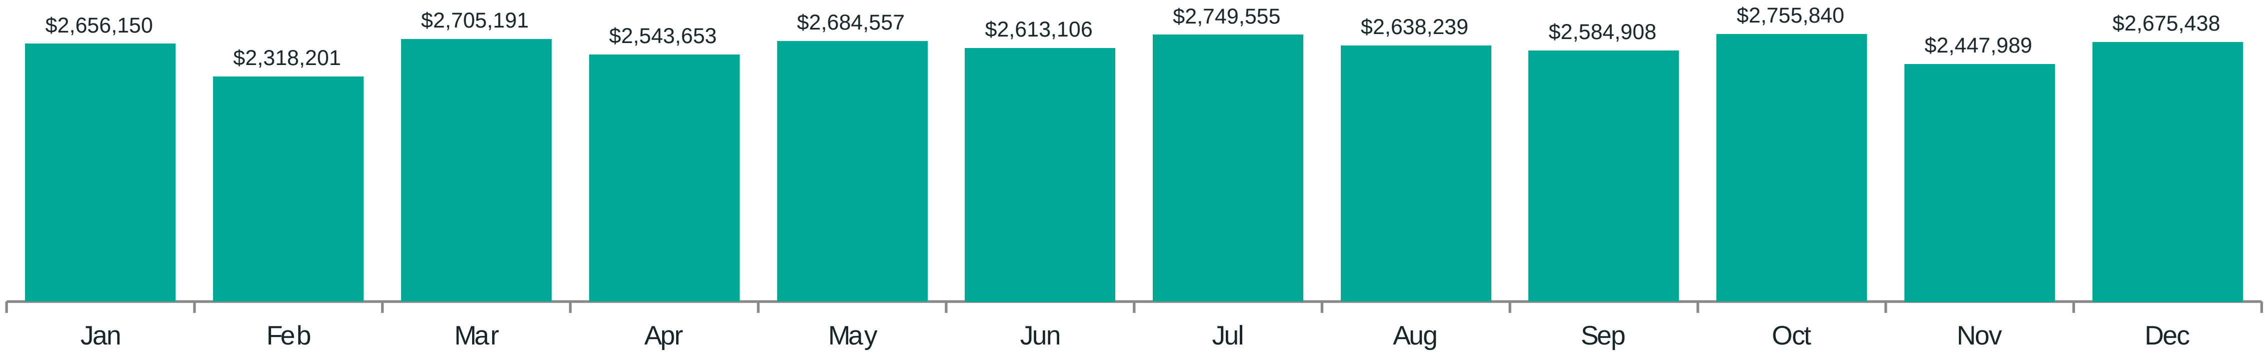
# Twelve months tell a consistent seasonal story

*Annual revenue was essentially flat — but were the twelve months equally flat?*

2021



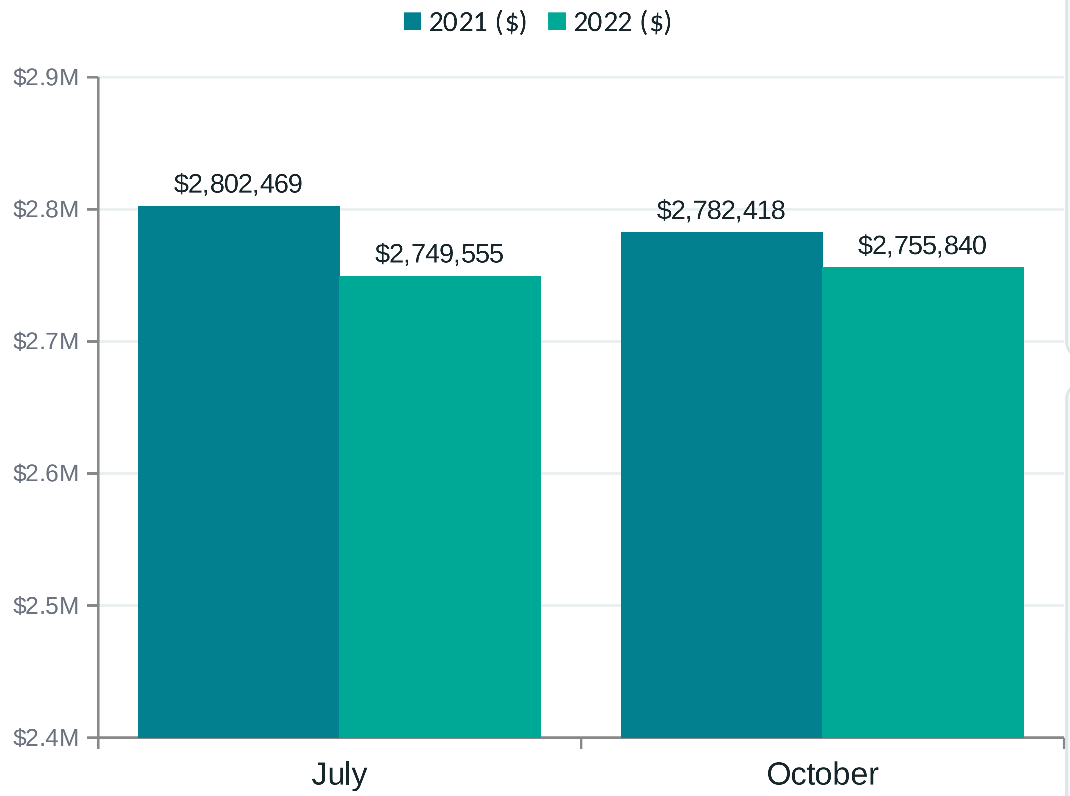
2022



**What this shows:** July and October are the two strongest months in both years, and both came in lower in 2022 than in 2021. The next slide looks closely at what happened in those two months.

# A closer look at the two months flagged on the previous slide

*Zooming into July and October only — not a new annual comparison*



**JULY 2022 vs 2021**

**−$52,914**

Clothing −6.1%, Technology −3.6% drove the decline.

Istinye Park −24.5% and Emaar Square −28.0% — losses were concentrated in these two malls.

**OCTOBER 2022 vs 2021**

**−$26,579**

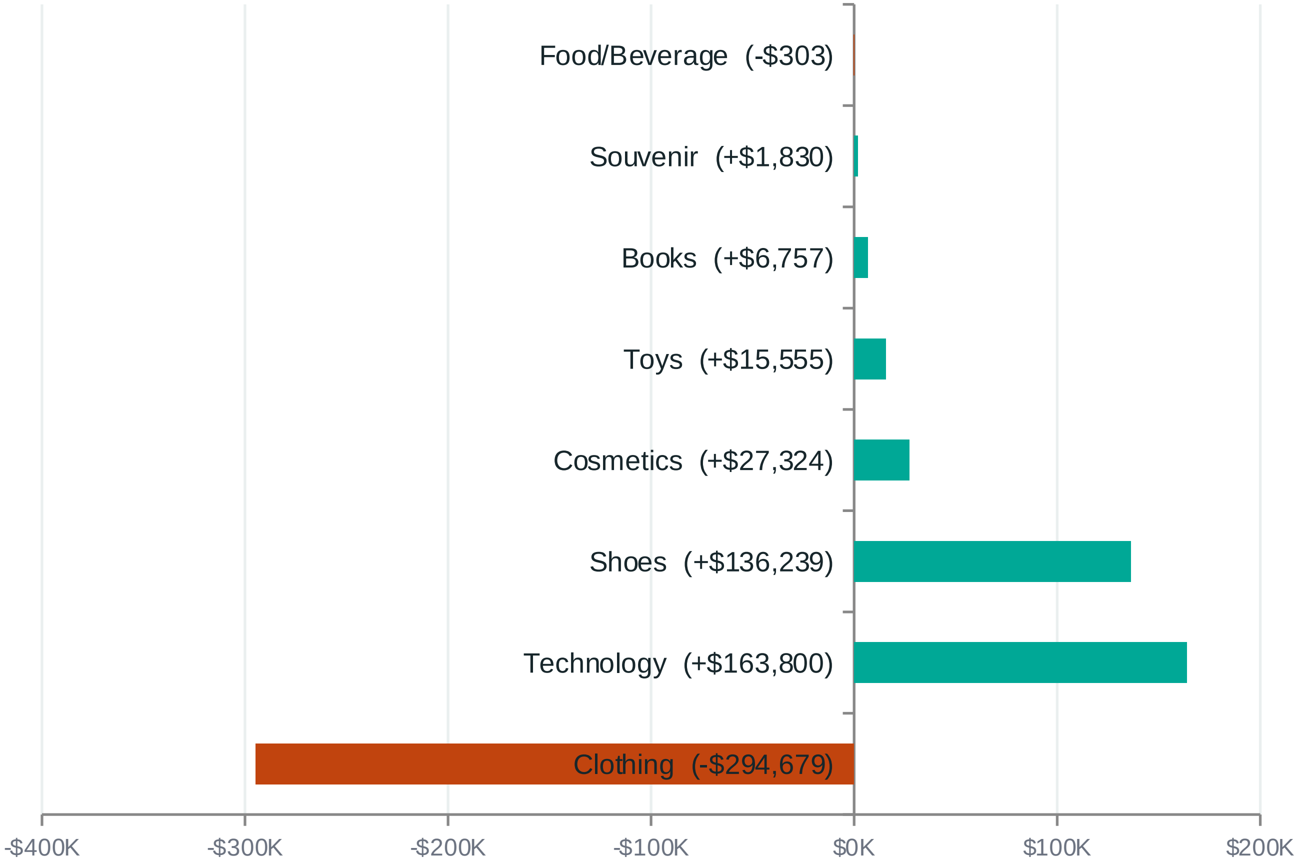
Shoes −12.1% (−$91,826) — this alone erased Clothing's +3.8% and Technology's +2.1% gains that month.

Emaar Square −20.4% and Cevahir AVM −15.8% were the weakest locations.

**Where we go next:** these two months explain part of the flat annual result. The rest of this review returns to the full 2021 vs 2022 year to look at category, mall, and customer trends.

# Clothing's decline was fully offset — with room to spare

*Back to the full year: revenue change by category, 2022 vs 2021 — summed across all 10 malls*



## What the numbers actually show

**Clothing: −$294,679**

This is the net change in Clothing revenue for 2022 vs 2021, added up across all 10 malls. Most malls sold less Clothing; a couple sold slightly more — netting to this single number. The next slide breaks it down mall by mall.

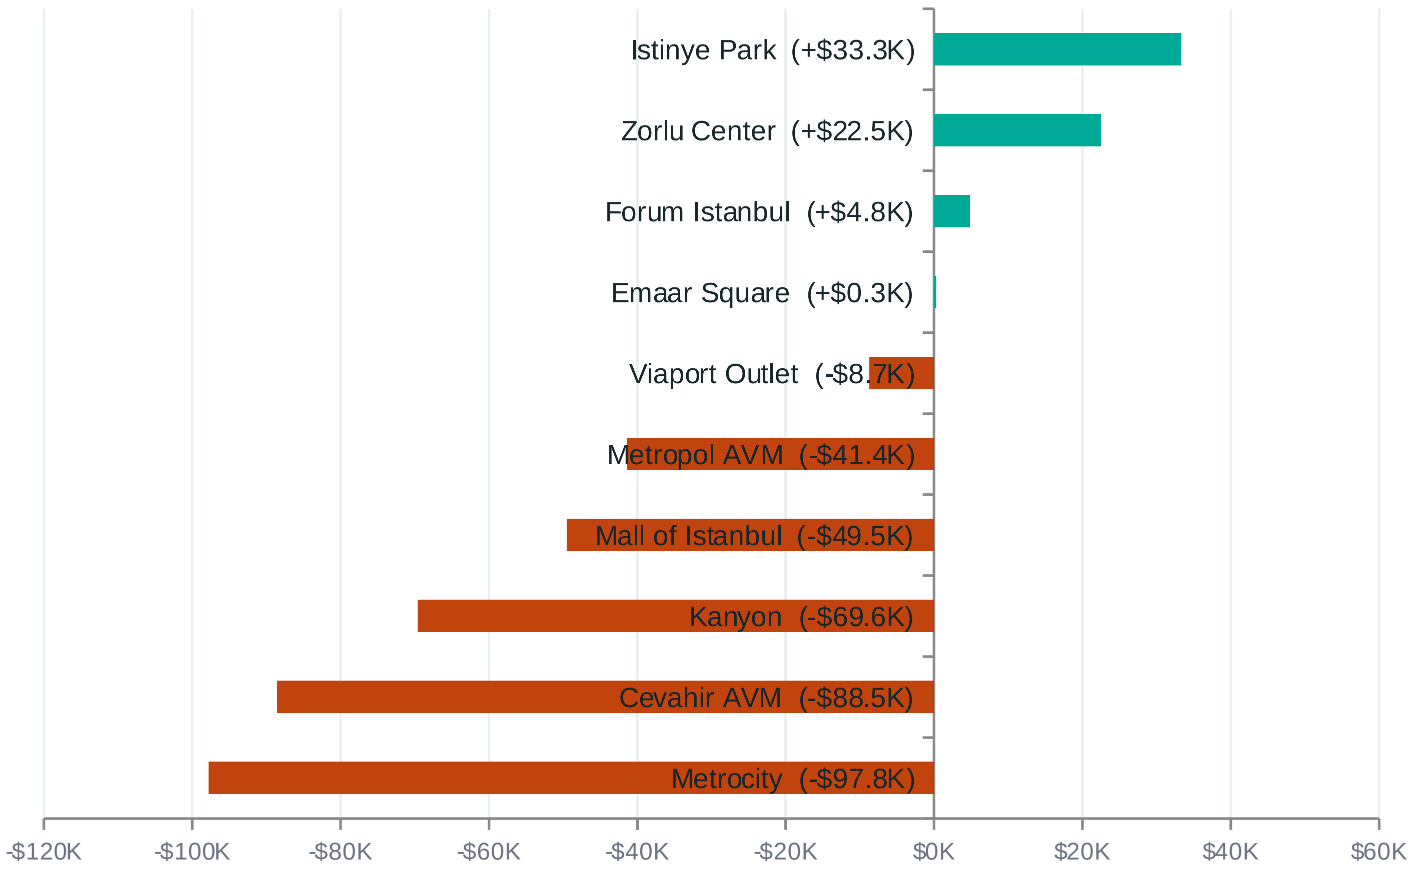
**Technology + Shoes: +$300,039**

($163,800 + $136,239) — together they more than covered Clothing's loss, by about $5,360.

**Bottom line: Technology and Shoes fully compensated for Clothing's decline (101.8% of the loss) — this is a category mix shift, not a shortfall.**

# The Clothing decline is concentrated in two malls

*Question: is the Clothing decline spread evenly, or concentrated? Bars below net to the -$294,679 shown on the previous slide.*



## Where to act

**Metrocity: −$97,826 (−4.4%)**

Largest absolute decline in Clothing revenue.

**Cevahir AVM: −$88,524 (−11.7%)**

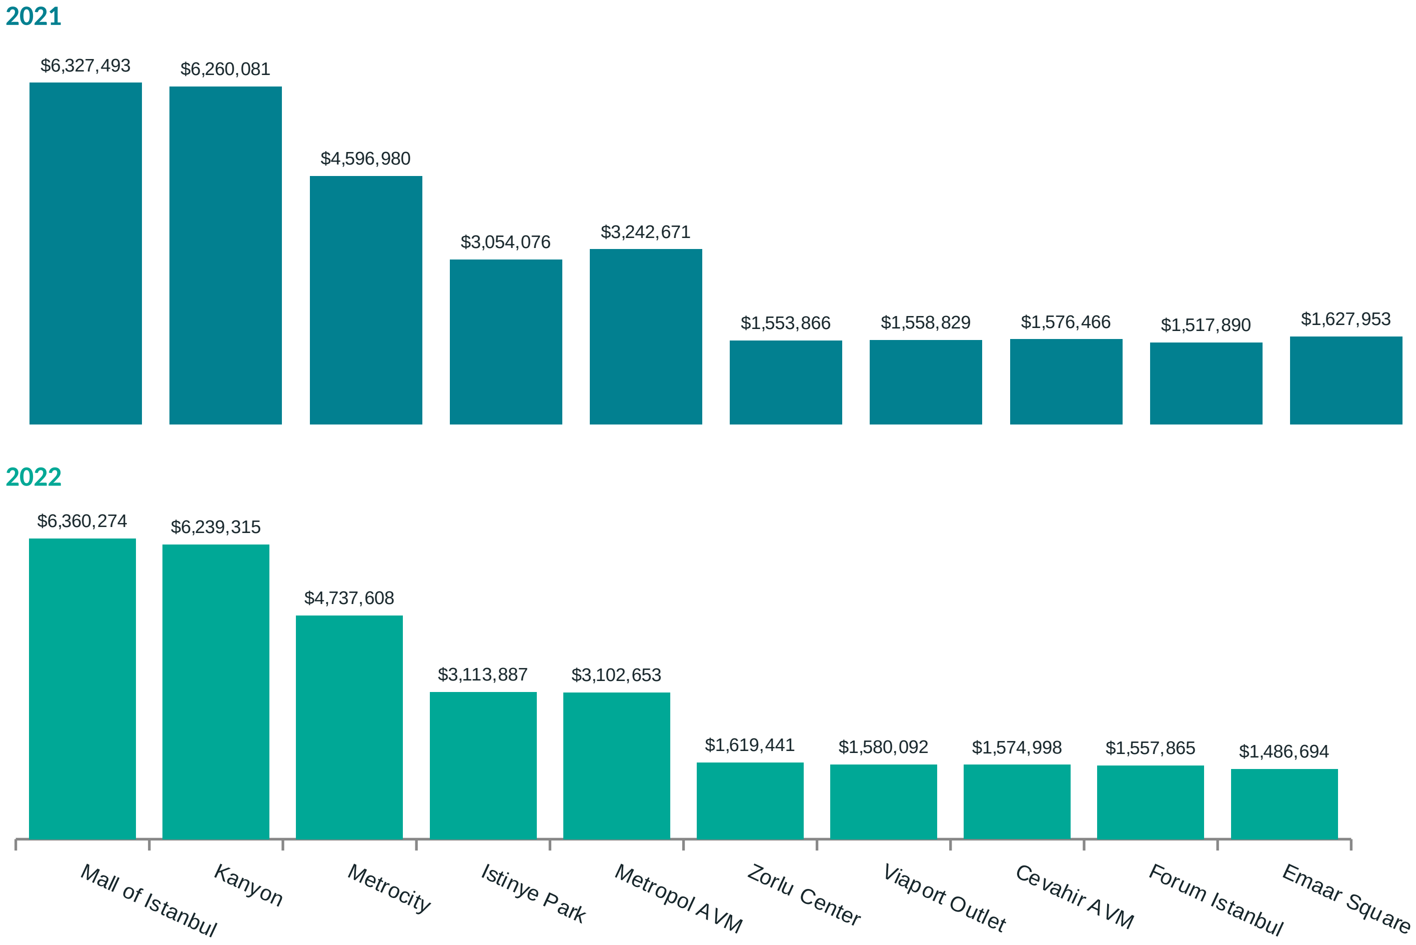
Largest percentage decline — steepest drop-off.

**Istinye Park & Zorlu Center**

Only two malls with Clothing growth (+$33.3K, +$22.5K) — worth studying for transferable tactics.

# Revenue concentration at the top held steady, 2021 to 2022

*Question: did revenue concentration among malls change too, or only the category mix? Full-year revenue below, same mall order both years.*



## Where revenue is concentrated

### Top 2 malls: ~40% both years

2021: $12,587,574 (40.2%)
2022: $12,599,589 (40.2%)
Mall of Istanbul + Kanyon — concentration is stable, not rising or falling.

### Top 3 malls: ~55% both years

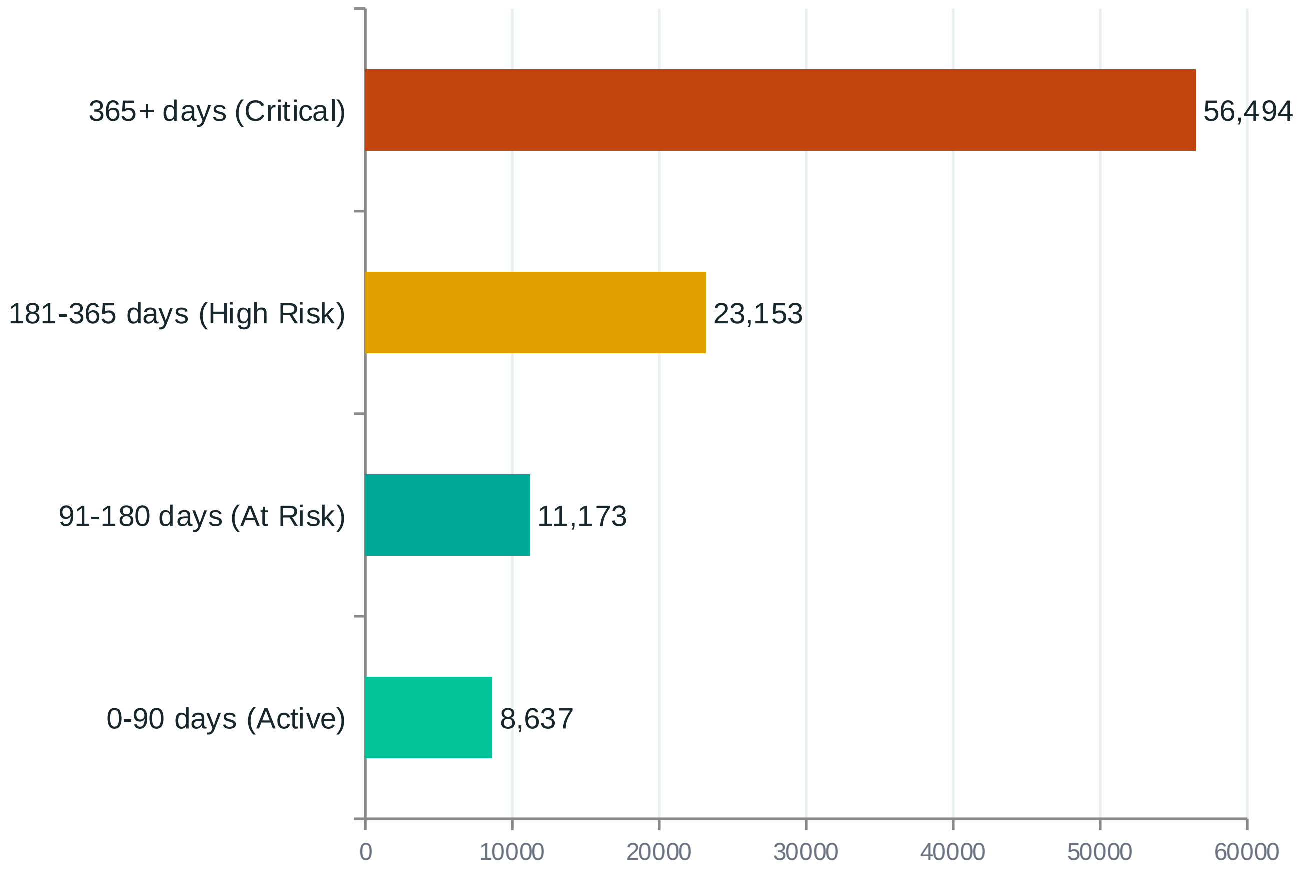
2021: $17,184,554 (54.9%)
2022: $17,337,197 (55.3%)
Add Metrocity — over half of all revenue sits in 3 of 10 locations, consistently.

### Biggest mover: Emaar Square

2021: $1,627,953 → 2022: $1,486,694
−$141,259 (−8.7%) — the largest full-year decline of any mall.

# Over half the customer base has gone quiet

*Question: how much of the business depends on customers who may already be gone? (Uses each customer's full purchase history, not just 2021–2022.)*



*56,494 customers (57% of the base) have not purchased in over a year, as of the March 2023 cutoff.*

## Revenue at risk (2022 base)

**High Risk**

23,153 customers

**$15.97M**

**At Risk + Critical Risk**

22,285 customers

**$15.33M**

**Active**

113 customers

**$75.8K**

Spending is similar across risk tiers (~3 items, ~$670–690/basket) — inactivity is not explained by basket size. Recency, not behavior, is the signal to act on.

RECOMMENDATIONS

# Three priorities, grounded in verified findings

01

### Rebalance Clothing inventory toward Metrocity and Cevahir AVM

These two malls drove 63% of the category's total decline (−$97.8K and −$88.5K). Istinye Park and Zorlu Center are the only malls where Clothing grew — worth a closer look at what's working there before reallocating stock.

02

### Protect July and October before they slip further

Both peak months underperformed 2021. July's drop was concentrated in Istinye Park and Emaar Square; October's was driven by a 12.1% collapse in Shoes. Pre-position footwear inventory and review premium-mall pricing ahead of these two months.

03

### Launch a 90-day re-engagement trigger for At Risk customers

22,285 customers ($15.3M in 2022 revenue) sit in the At Risk / Critical Risk window. Basket size doesn't predict who leaves — timing does. Prioritize outreach at the 90–180 day mark, before customers cross into the 365+ day tier.
