CUSTOMER SHOPPING DATA — REVIEW

Retail Performance 2021–2022

A fact-checked review of revenue, category, mall, and churn performance across 10 malls — every figure below is traced back to source SQL and validated.

$62.7M	99,457	+0.18%	10
Total Revenue 2021–2022	Transactions	YoY Revenue Growth	Shopping Malls

Source: customer_shopping_data_cleaned • 99,457 rows • Jan 2021 – Dec 2022

EXECUTIVE SUMMARY

Revenue is flat — the volume story hides a value problem

$31.3M → $31.4M

Total revenue, 2021 → 2022

+$56,521 (+0.18%)

45,678 → 45,973

Transactions, 2021 → 2022

+295 (+0.65%)

$686.10 → $682.30

Average basket size

-$3.80 (-0.55%)

$686.00 → $682.80

Revenue per transaction

-$3.20 (-0.47%)

The question this raises

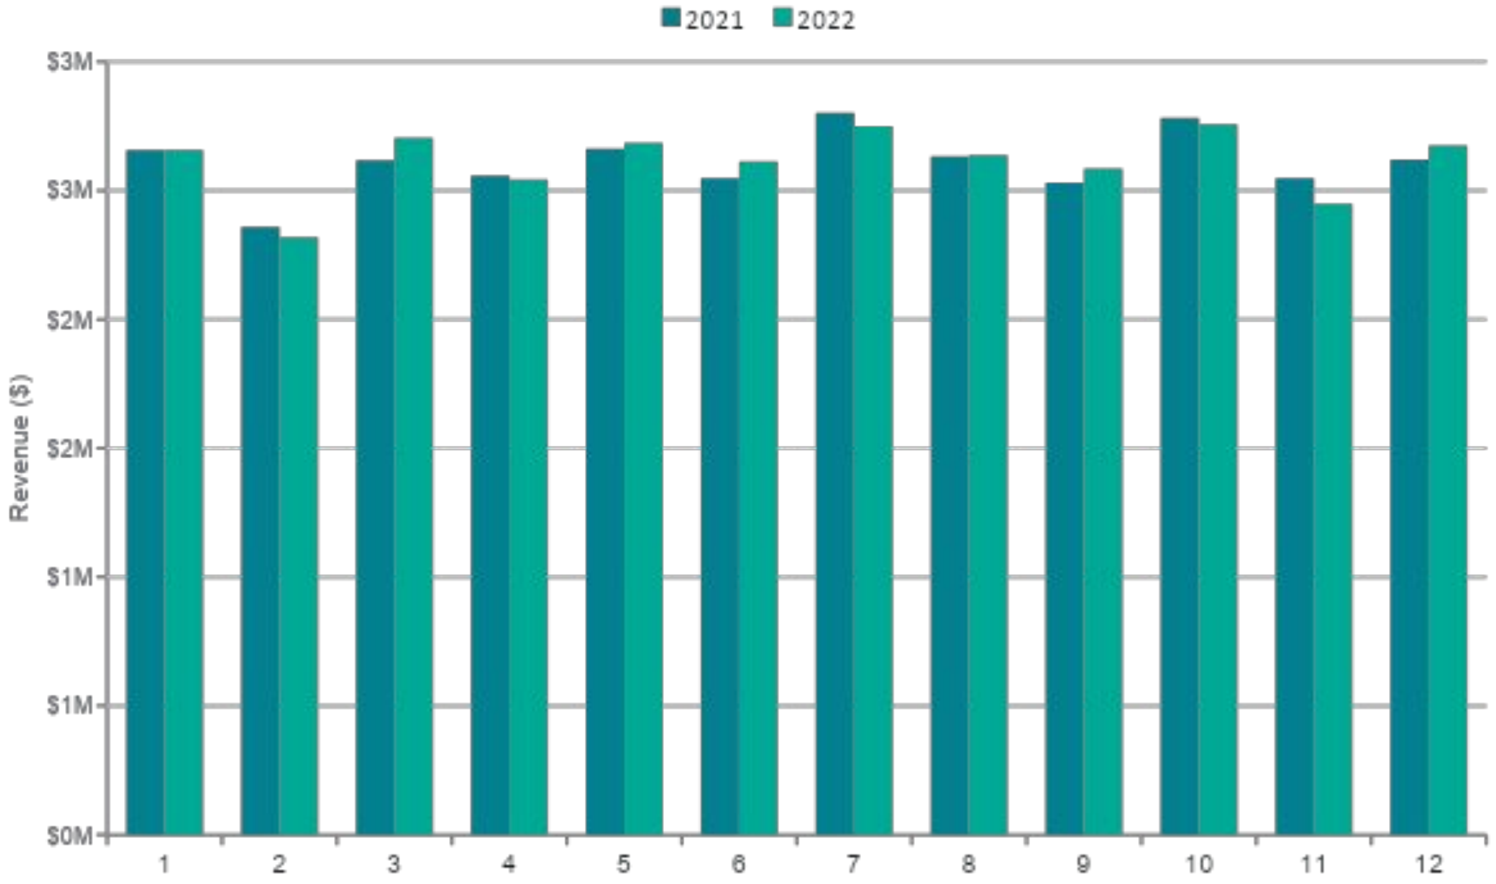
Transactions grew 0.65% but revenue grew only 0.18%. More shoppers walked in — but each one spent slightly less. Growth from here depends on lifting spend per visit, not just driving more foot traffic.

What's inside this review

- Which category drove the flat result, and whether it was offset
- Where revenue is concentrated across the 10-mall portfolio
- How much revenue sits with customers who may already be lost
- One open data-quality question flagged for follow-up

REVENUE PERFORMANCE

Twelve months tell a consistent seasonal story



July and October are consistently the two strongest months in both years

PEAK MONTHS

Jul & Oct — highest revenue in both 2021 and 2022

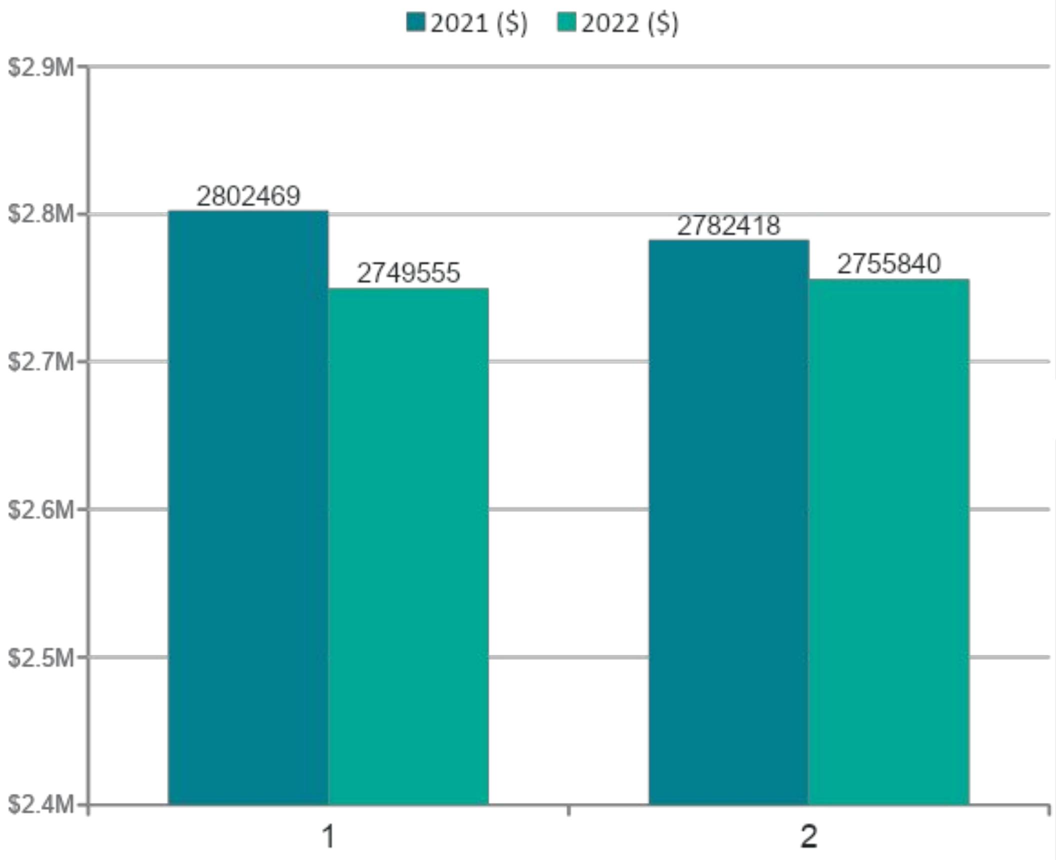
LOW MONTHS

Feb is the lowest month both years; Sep is consistently soft

2022 SHIFT

Both peaks came in lower than 2021 (see next slide)

Both peak months underperformed their 2021 level



JULY 2022 vs 2021

−$52,914

Clothing −6.1%, Technology −3.6% drove the decline.

Istinye Park −24.5% and Emaar Square −28.0% — losses were concentrated in these two malls.

OCTOBER 2022 vs 2021

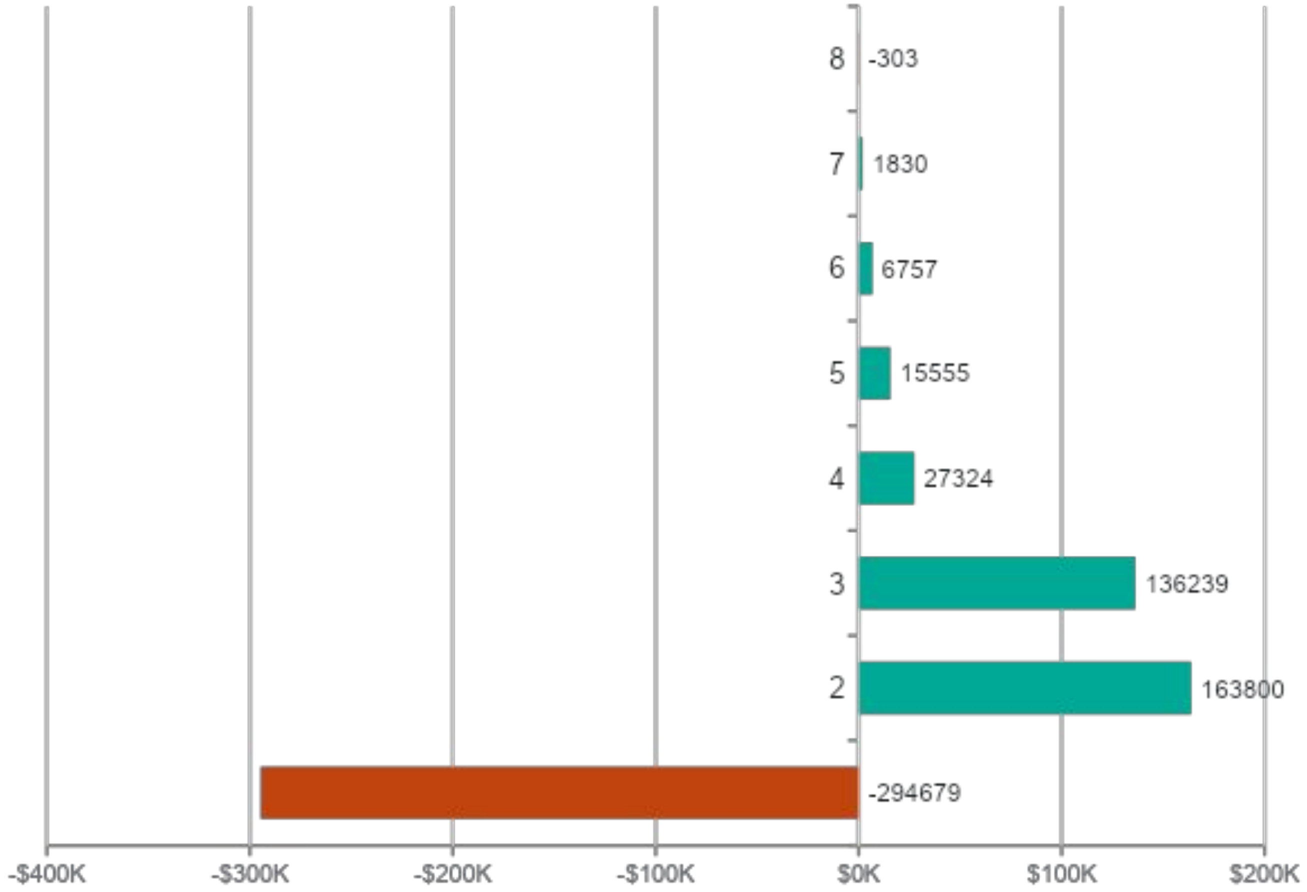
−$26,579

Shoes −12.1% (−$91,826) — this alone erased Clothing's +3.8% and Technology's +2.1% gains that month.

Emaar Square −20.4% and Cevahir AVM −15.8% were the weakest locations.

CATEGORY ANALYSIS

Clothing's decline was fully offset — with room to spare



What the numbers actually show

Clothing: −$294,679

The single largest drag on 2022 revenue.

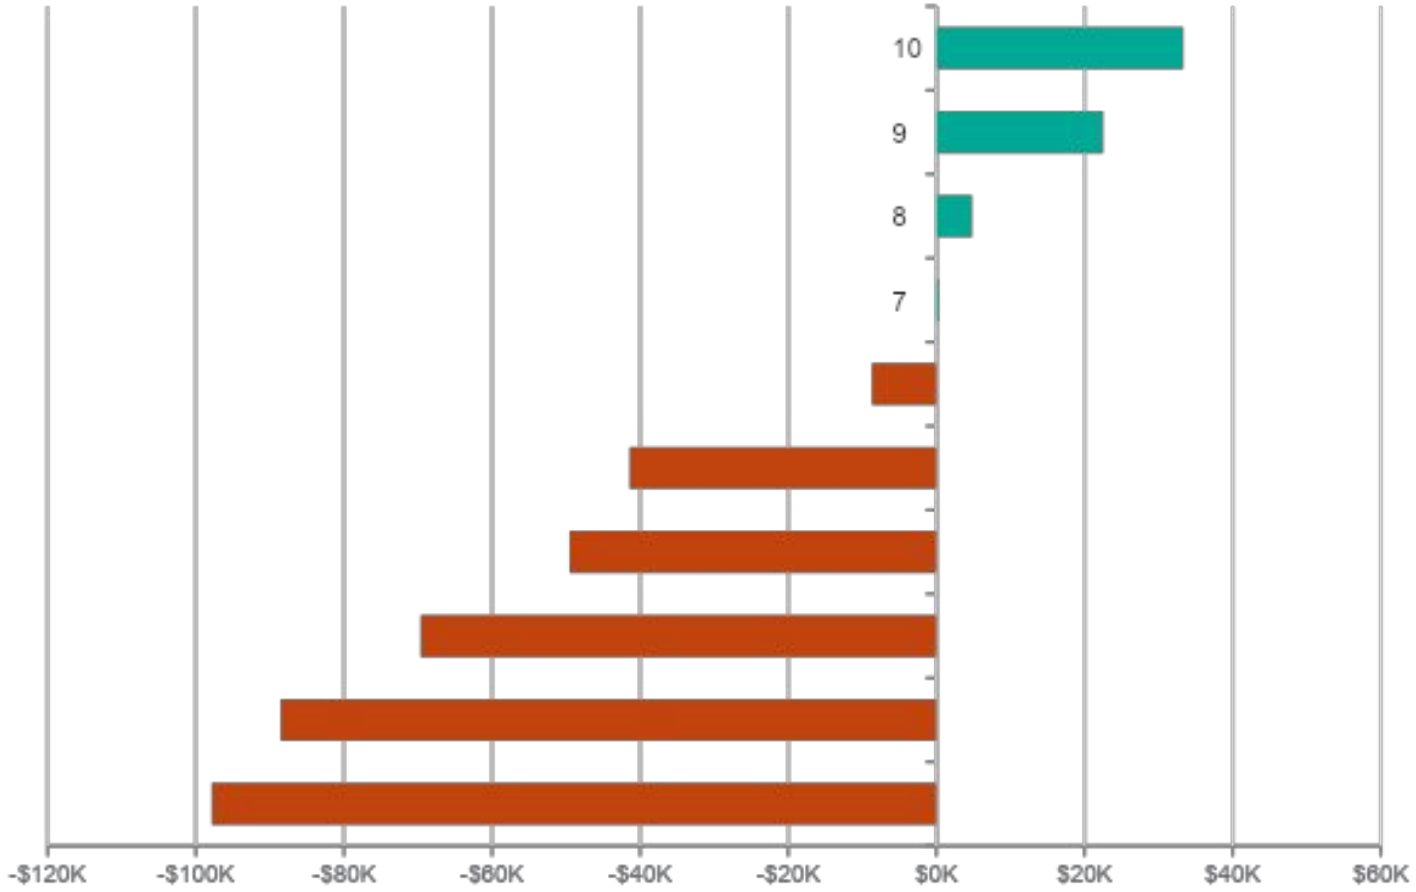
Technology + Shoes: +$300,039

($163,800 + $136,239) — together they more than covered Clothing's loss, by about $5,360.

BOTTOM LINE

Technology and Shoes didn't just cushion the Clothing decline — combined, they fully compensated for it (101.8% of the loss) and left overall revenue essentially flat. The 2022 result is not a shortfall story; it's a category mix shift.

The Clothing decline is concentrated in two malls



Where to act

Metrocity: −$97,826 (−4.4%)

Largest absolute decline in Clothing revenue.

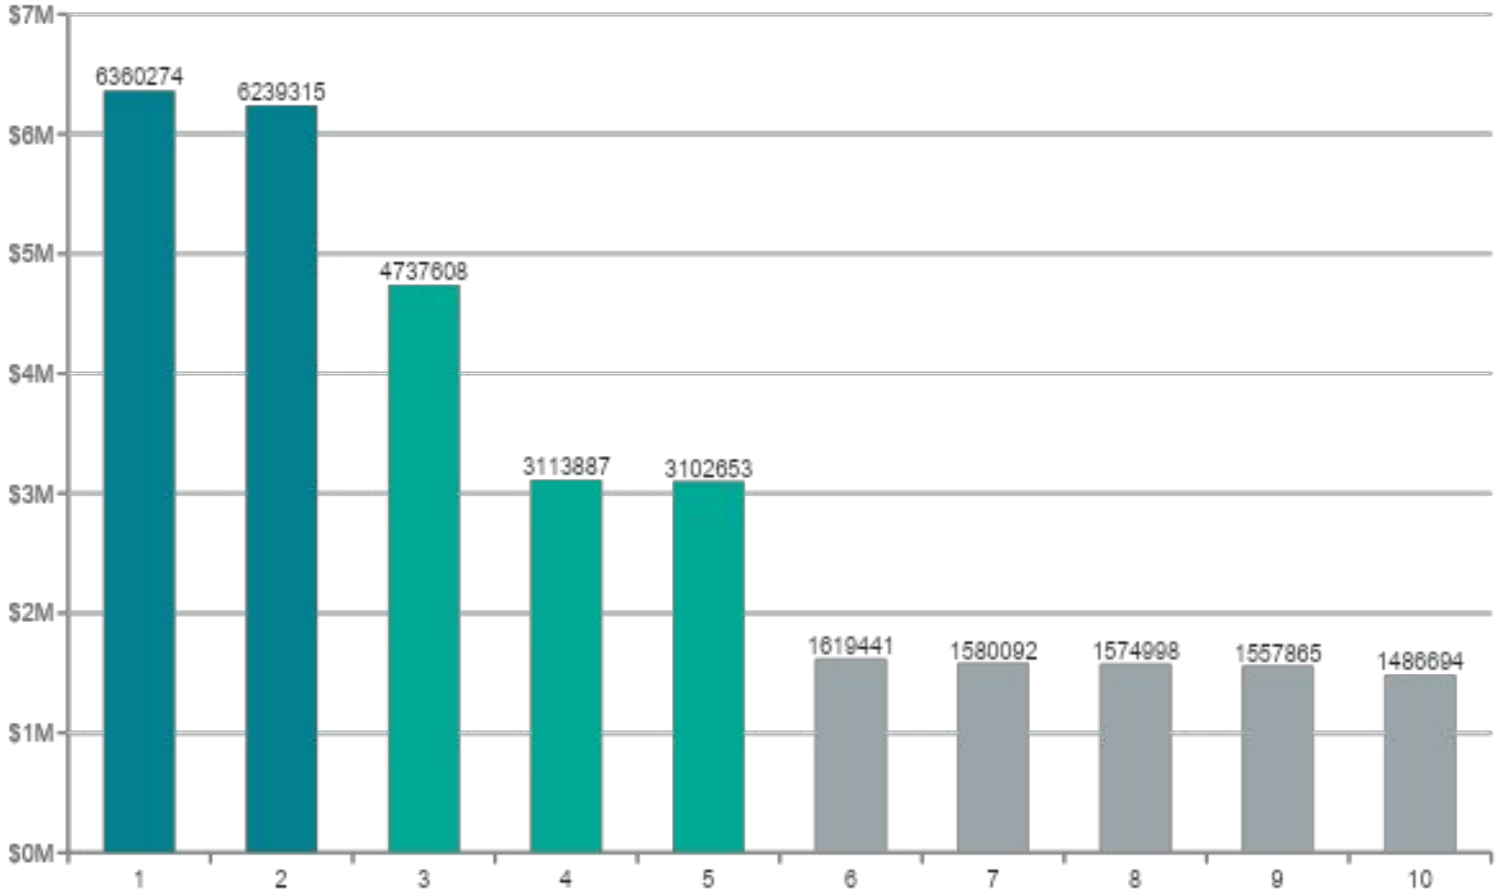
Cevahir AVM: −$88,524 (−11.7%)

Largest percentage decline — steepest drop-off.

Istinye Park & Zorlu Center

Only two malls with Clothing growth (+$33.3K, +$22.5K) — worth studying for transferable tactics.

Revenue is concentrated at the top of the portfolio



All 10 malls shown — sums to the full $31.4M 2022 total.

Concentration, stated correctly

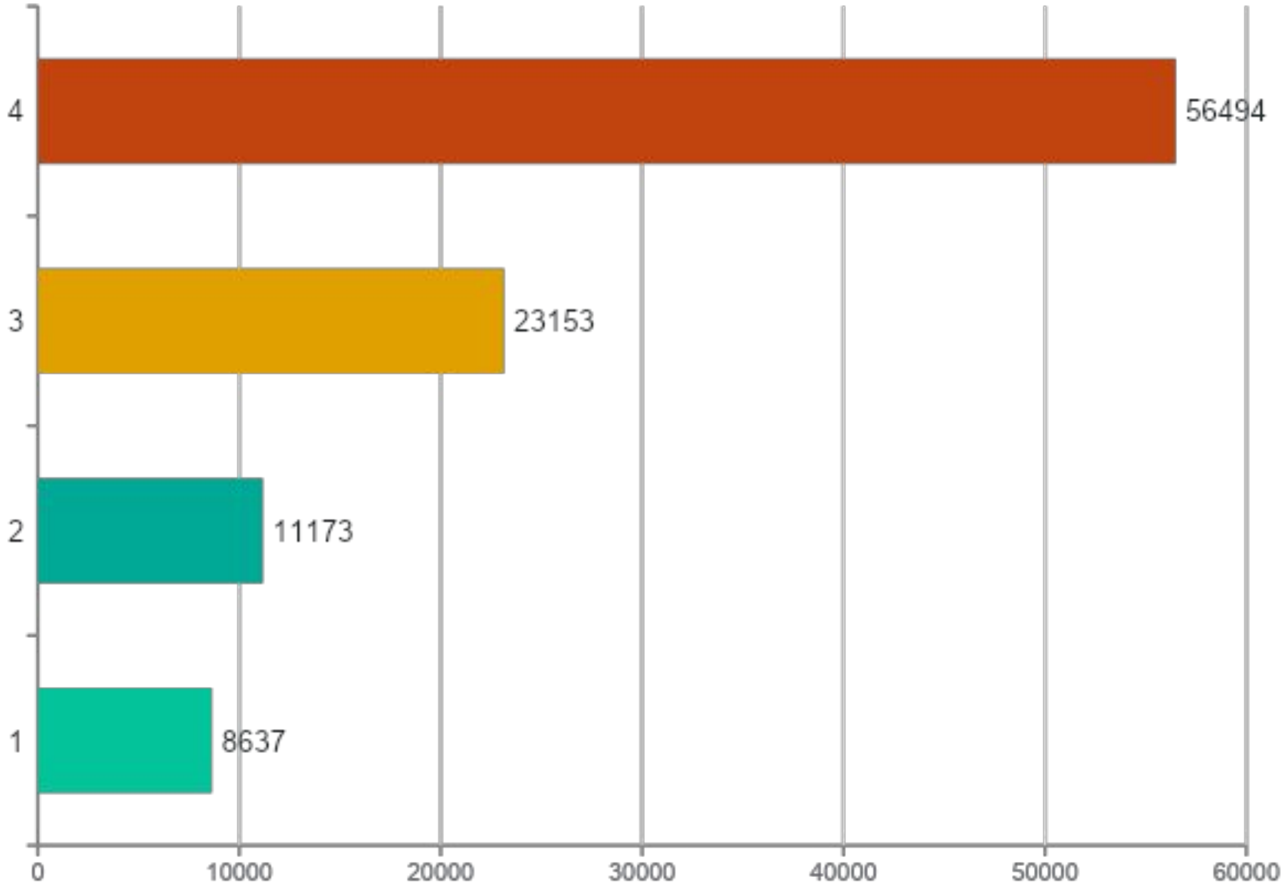
Top 2 malls: $12.6M (40%)

Mall of Istanbul + Kanyon combined generate more revenue than the bottom 5 malls combined ($7.8M).

Top 3 malls: $17.3M (55%)

Add Metrocity, and just 3 of 10 locations account for over half of total portfolio revenue.

Over half the customer base has gone quiet



56,494 customers (57% of the base) have not purchased in over a year, as of the March 2023 cutoff.

Revenue at risk (2022 base)

High Risk
23,153 customers
$15.97M

At Risk + Critical Risk
22,285 customers
$15.33M

Active
113 customers
$75.8K

Spending is similar across risk tiers (~3 items, ~$670–690/basket) — inactivity is not explained by basket size. Recency, not behavior, is the signal to act on.

OPEN ITEM

One reconciliation gap to close before this goes further

Transaction counts by mall don't add up to the reported yearly total

2021: sum of transactions across 10 malls = 45,382, vs. 45,678 reported for the year → gap of 296

2022: sum of transactions across 10 malls = 45,551, vs. 45,973 reported for the year → gap of 422

Note: revenue totals reconcile exactly (mall-level sums match the $31.3M / $31.4M totals). Only the transaction count is affected — likely a counting-method or NULL-value issue, not a revenue issue.

Recommended queries to run before finalizing

- Check for NULL or blank shopping_mall values on transactions in 2021–2022
- Compare total transaction count per year against the sum of transactions grouped by mall for the same year
- Compare COUNT(*) (rows) against COUNT(DISTINCT invoice_no) — confirm whether "transaction" means a line item or a unique invoice
- Check for whitespace or casing variants in shopping_mall values that could split one mall into two labels

RECOMMENDATIONS

Three priorities, grounded in verified findings

01

Rebalance Clothing inventory toward Metrocity and Cevahir AVM

These two malls drove 63% of the category's total decline (−$97.8K and −$88.5K). Istinye Park and Zorlu Center are the only malls where Clothing grew — worth a closer look at what's working there before reallocating stock.

02

Protect July and October before they slip further

Both peak months underperformed 2021. July's drop was concentrated in Istinye Park and Emaar Square; October's was driven by a 12.1% collapse in Shoes. Pre-position footwear inventory and review premium-mall pricing ahead of these two months.

03

Launch a 90-day re-engagement trigger for At Risk customers

22,285 customers ($15.3M in 2022 revenue) sit in the At Risk / Critical Risk window. Basket size doesn't predict who leaves — timing does. Prioritize outreach at the 90–180 day mark, before customers cross into the 365+ day tier.
