Logistics Performance Overview

A network-wide review of shipment volume, delivery outcomes, cost efficiency, and seasonal trends across 10 warehouses and 7 carriers.

ⓘ **Synthetic data notice:** this report is built on an AI-generated sample dataset for demonstration purposes only. Carrier and warehouse names (e.g. Amazon Logistics, FedEx, UPS, USPS, DHL, OnTrac, LaserShip) are labels inherited from the source dataset and do **not** reflect the real-world performance of these companies.

2,000	$401,911.57	2.55M	$205.16	4.18
Total Shipments	Total Transportation Cost	Total Distance Covered miles	Average Shipment Cost	Average Transit Time days

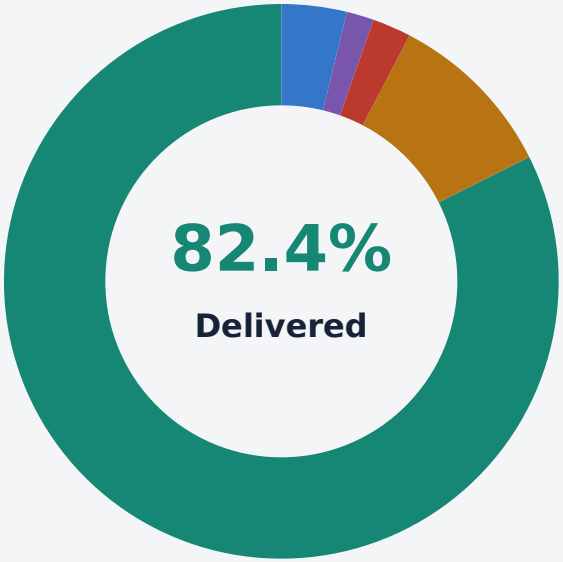

Questions This Report Investigates

1. Where are delivery problems occurring, and which warehouses or carriers are driving them?
2. Which warehouse–carrier combinations create the highest delivery risk, and which perform best?
3. Are delivery issues associated with shipment characteristics such as weight, distance, or cost?
4. Are there seasonal patterns in logistics performance that put peak-period deliveries at risk?

Delivery exceptions affect 276 shipments

13.8% delayed, lost or returned

76 additional shipments remain In Transit (3.8%).

Status	Count	Share	Cost
Delivered	1648	82.40%	$335.7K
Delayed	199	9.95%	$39.1K
Lost	45	2.25%	$7.9K
Returned	32	1.60%	$6.3K
In Transit	76	3.80%	$12.9K

45 lost shipments incurred $7,889 in transport costs

Amazon Logistics and USPS account for 53.3% of losses on 28.3% of volume. Require handoff scans and daily follow-up on missing scans for these carriers first.

Cost completeness: 1,959 of 2,000 shipments have recorded transport costs. The $7,889 exposure excludes product value and claims recovery.

PRIORITY WAREHOUSE-CARRIER PAIRS

Different failure patterns need different controls

Warehouse / carrier	Shipments	Delivered	Delayed	Lost
MIA / USPS	25	**68.0%**	12.0%	12.0%
ATL / Amazon Logistics	33	**69.7%**	18.2%	9.1%
HOU / Amazon Logistics	29	**69.0%**	20.7%	6.9%
CHI / LaserShip	28	**96.4%**	0.0%	0.0%

Weight and distance groups show no statistically clear increase in issue rates. Target the flagged pairs, rather than introducing broad shipment restrictions.

MIA / USPS and ATL / Amazon: prevent repeat losses

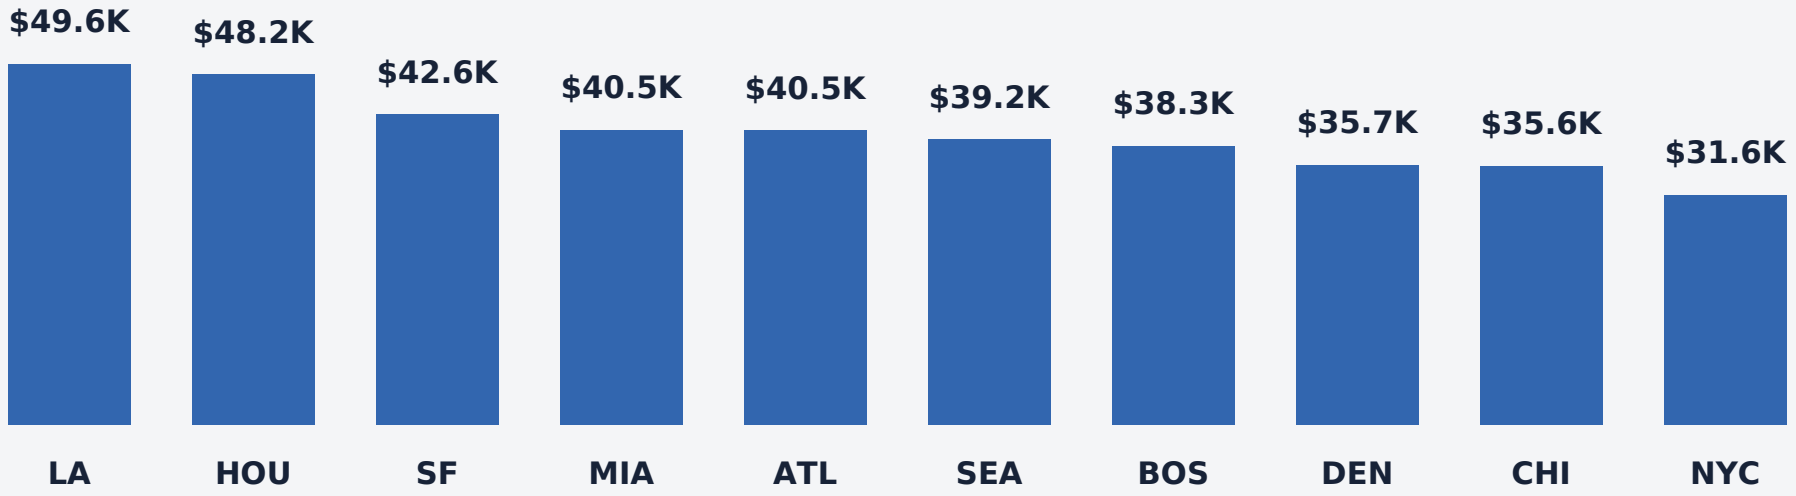

Pilot handoff scans, daily missing-parcel follow-up and carrier claims. Each pair recorded three losses. ATL also needs missed-pickup escalation.

HOU / Amazon: intervene before an order misses dispatch

Set pickup cutoffs and missed-pickup alerts. Use CHI / LaserShip as an operating reference, while allowing for the small group sizes of 25-33 shipments.

LA and HOU combine high volume with high unit costs

Total recorded transport spend by warehouse

LA + HOU: $97.7K

24.3% of spend on 21.6% of shipments

Average recorded costs are $229.57 in LA and $231.52 in HOU, versus $185.39 in CHI. LA has heavier shipments; HOU has a lower average weight but higher cost.

Carrier price alone gives an incomplete ranking

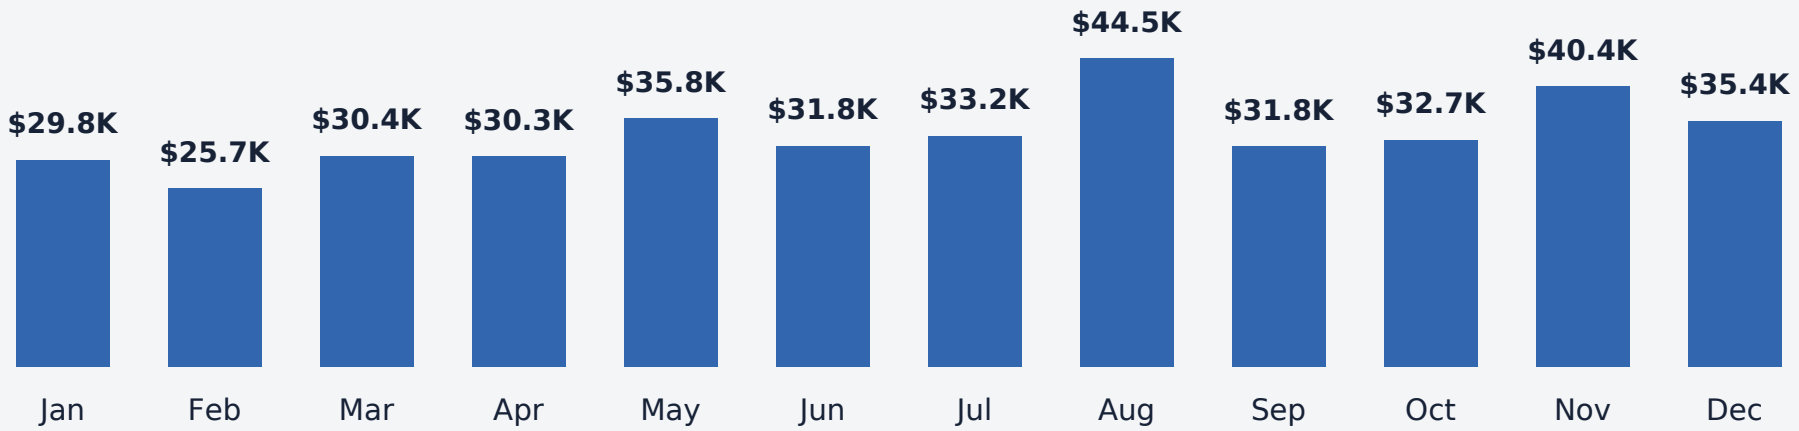

Pilot UPS on reliability-sensitive lanes and obtain competitive quotes for routine shipments. UPS has the stronger observed service record, while USPS combines a lower price with higher losses. Test comparable lanes before reallocating volume.

Use matched lane quotes to reduce LA/HOU costs, without reducing Delivered share.

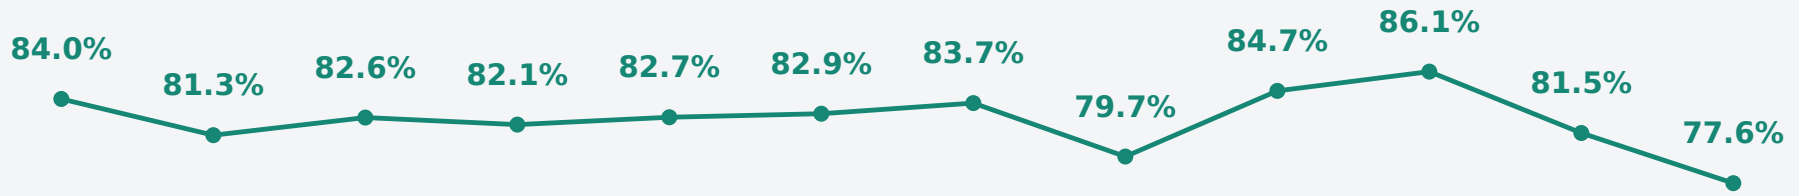

MONTHLY PERFORMANCE

Cost pressure and service weakness peak in different months

Recorded transport cost

Delivered share

Control unit costs before increasing the budget. In November, cost per shipment rose 21% from October while volume rose only 3%. Obtain competing lane quotes and cap unapproved surcharges.

Prepare year-end dispatch alerts and backup pickups. December delay rates rose to 14.1%; catch missed departures before they become customer delays.

BASE FORECAST FROM 2023 HISTORY

2024 outlook: stable workload and spend near $36.6K a month

2023 actuals **2024 expected: 3-month moving average**

Monthly shipments

About 173 / month

Monthly transport cost ($K)

About $36.6K / month

Average transit time (days)

About 4.1 days

Plan routine resources for stable demand. Keep extra carrier capacity flexible, rather than committing to expansion on an unconfirmed growth trend.

The recent-average method had lower historical test error. Refresh this baseline monthly.

RECOMMENDED ACTION PLAN

Start with focused service controls and cost pilots

Priority	Action and accountable team	Measure of success
Prevent losses MIA-USPS; ATL-Amazon	Operations and carrier managers: pilot handoff scans, reconcile missing scans daily and pursue eligible claims.	**Fewer lost shipments and higher claim recovery.**
Prevent delays HOU-Amazon; DHL	Carrier managers: agree dispatch cutoffs and escalation. Reserve flexible backup pickups for year-end exceptions.	**Lower delay share without a rise in cost per comparable order.**
Reduce unit costs LA and HOU	Procurement: compare equivalent lane quotes and pilot cheaper allocations. Use UPS as a reliability reference, not a blanket replacement.	**Lower comparable-shipment cost with Delivered share maintained.**

Pilot first, then expand based on measured improvement

Launch within 30 days and compare results over 90 days. Expand only when service improves and cost stays within the agreed limit.
